

- Add a Master/Detail page for Customer showing all of the Customer's Functions as the Details records. **Create a separate CustomerFunction controller for this purpose.**
 - This will work as the "Details" view for an individual Customer.
 - Details of the Customer must be displayed at the top of the View, including the Profile Picture.
 - Beneath that show a table listing all of the Functions for the Customer.
 - Allow the user to sort, filter and page the functions for the Customer.
 - Filter by Function Type, Text in the Name/Lobby Sign and Date Range* for the Function (just dates ignoring time of day).
 - Sort by the same properties you do on the current Function Index.
 - The user should be able to Add, Update and Delete functions from this page, but only in relation to the one Customer.
- When you are finished, publish/Update the final version of your application on Azure.
 - Put a link to the app in Azure on the Home Index View as well as in the comments when you submit your work to Blackboard.
